countries you both the sample and control genomic nucleic acid and the array contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus contact and compared with the relative copy numbers of sequences in the case sample as compared with the relative copy numbers of substantially contact as compared with the relative copy numbers of substantially contact as equences in the control. The hybridization of the genomic cor its fragment, that is specific for a nucleic acid/nucleic acid hybrid. Cor its fragment, that is specific for a nucleic acid/nucleic acid hybrid. Cor its fragment, that is specific for a nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moisty such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic carrays. The genomic array comprises nucleic acid that is prepared from Compared to a contact a contact and contact a c

Polynucleotide for detecting single nucleotide polymorphisms existing human gene, contains isolated human gene having specified sequence. 11

Claim 2; SEQ ID NO 1262; 529pp; Japanese.

present The invention comprises isolated human gene sequences and PCR p sequences which can be used to detect single nucleotide polymor (SNPs). The DNA sequences of the invention are useful for detec existing in human genes and for the diagnosis of human disease. DNA sequence represents a human gene PCR primer of the are useful for deractions are neeful for deractions are useful for deractions are the statement of the state primer invention SNPe

The siNNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the bunan ERG2 (vets erythroblastosis virus E26 oncogene like (avian))
                                                                                                                                                                                                                                                                  20-FEB-2002; 2002US-0358580P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERG2 (v-ets erythroblastosis virus E26 oncogene like (avian))
                                                                                                                          New double-stranded short interfering nucleic acid molecule, useful for
                                                                                                                                                                                                                                                                                               11-MAR-2002;

The PAF-AH product is useful for treating or preventing diabetes, for slowing the progression of diabetes mellitus, or for reducing the incidence of diabetes mellitus. Note: The sequence listing included with this patent seems to be from a totally different patent. Only 2 human sequences were mentioned in the text, not the 38 (2 yeast plus 36 synthetic) sequences shown. The present sequence is one of the 36 sequences included in the sequence is one of the 36 sequences included in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERG2 (v-ets erythroblastosis virus E26 oncogene like (avian)) siDNA-RNA hybrid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New

Specifically, it refers to the detection CC of epigenetically silenced genes. Specifically, it refers to the detection CC are transcriptionally inactive due to aberrant methylation at normally cCC unmethylated CpG islands. Accordingly, these genes provide diagnostic CC diagnose various proliferative disorders, particularly ossophageal cancer CC and head and neck cancer. The present invention describes a genomic CC screening method to identify silenced genes in a cell suspected of a CC predisposition to, or exhibiting, unregulated growth. Accordingly, CC oligonuclectides of the genes identified herein are useful for detecting CC carcinoma. Furthermore, treatment can occur via gene therapy, using a CC demethylation agent such as a methyltransferase inhibitor (5Aza-dC) or a cmethylation silenced gene in cancer cells. This oligonuclectide sequence cc methylation silenced gene in cancer cells. This oligonuclectide sequence cc a result of treatment with a demethylation agent that were up-regulated as a continuous cell of treatment with a demethylation agent i.e epigenetically cc silenced genes of the invention.
                                                                                                                                                                                                                                                                                                                                                 RESULT 1804
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                  The invention comprises a high throughput method for assessing genomic cpG methylation and expression of genomic sequences of a tissue sample. The method involves the use of a microarray that has affixed CpG-rich genomic probe fragments each comprising an exon sequence (or portion thereof) of an expressible gene. The method and microarray of the invention are useful for assessing genomic CpG methylation and expression of genomic sequences of a tissue sample. The method is useful for the identification of novel methylation-silenced genes that are reactivated upon methylation and in determining the efficacy and mechanisms of demethylation action in cancer cells. The present DNA sequence represents a PCR primer that was used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                              gastric ulcer, arteriosclerosis, hyperlipemia, Alzheimer's disease, dementia, obseity, pulmonary fibrosis, renal fibrosis, immune deficiency, infertility, urinary blockage and cancer (such as cancer of the brain, neck, tongue, lung, breast, pancreas, stomach, colon, duodenum, prostate, bladder, ovary, womb or rectum). Primers of the invention are devised and synthesised based on G-protein coupled receptor consensus sequences and used for 5'-RACE (rapid amplification of cDNA ends) and 3'-RACE amplification of human cDNA derived from advanced and visual cortex RNA. Sequences given in ADE34534-ADE34533 represent human G-protein coupled receptor proteins, genes encoding them, and primers for the amplification of these sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; antiinflammatory; hepatotropic; nephrotropic; dermatological; antiarthritic; antiasthmatic; antidiabetic; hypotensive; antiulcer; antilipemic; antiatteriosclerotic; nootropic; neuroprotective; anorectic; immunomodulator; uropathic; antilifertility; G-protein coupled receptor; GPCR; GPCR185; GPCR186; GPCR187; GPCR189; GPCR222; GPCR223; hepatitis; nephritis; dermatitis; panoreatitis; rheumatoid arthritis; osteoarthritis; acopic dermatitis; asthma; disbetes; hypertension; inflammatory bowel disease; gastric ulcer; arteriosclerosis; hyperlipemia; Alzheimer's disease; dementia; obesity; pulmonary fibrosis; renal fibrosis; immune deficiency; infertility; urinary blockage; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                origin. These proteins include GPCR185, GPCR186, GPCR187, GPCR188, GPCR189, GPCR22 and GPCR222. Proteins of the invention are used in the treatment and prevention of diseases associated with inflammation, angiogenesis and tissue neogenesis, including hepatitis, nephritis, dermatitis, pancreatitis, rheumatoid arthritis, osteoarthritis, atopic dermatitis, asthma, diabetes, hypertension, inflammatory bowel disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     G-protein coupled receptor proteins, genes encoding them and antibodies recognizing them for treatment and diagnosis of cancer, inflammatory and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gastrointestinal disorders.

                                                                                                                        The invention relates to a method of diagnosing recurrent pregnancy (RPL). The method involves examining formin (Fmn)-2 gene for a muta and measuring biological activity and expression of Fmn-2, in which decreased levels indicates an increased risk for RPL; or examining person's formin-2 gene for polymorphisms, in which the presence of polymorphism indicates an altered risk for RPL. The method is used diagnosing and treating RPL e.g. in humans. The present sequence is
                                                                                                                                                                                                                                           Diagnosing recurrent pregnancy loss comprises examining formin-2 gene for a mutation and measuring biological activity and expression of formin-2 identified to play a role in occyte development.

                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid (NI) comprising at CC least 20 but not more than 1500 consecutive nucleotides of the optineurin CC promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin CC promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample CC in a promoter region of the optineurin gene, associated with a glaucoma CC in a promoter region of the optineurin gene, associated with a glaucoma CC in a sample containing DNA, detecting a SNP sequence variation in a sample containing CC DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing the presence or increased consecutive to glaucoma or to a progressive ocular hypertensive CC disorder resulting in loss of visual field in a patient (or the severity consecutive and amplifying the DNA) and detecting a polymorphism (comprising providing containing the variation within the optineurin containing the presence of amplification of a selected containing a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and cC capable of detecting a SNP located within an optineurin promoter, and containing the providing and containing the presence of an optineurin promoter and also to treat glaucoma related disorders. The containing the providing and providers and containing the presence of an optineurin promoter motif, repeat element or containing the provider motif, repeat element or contains or provider motif, repeat element or contains or contains promoter motif, repeat element or contains contains contains promoter motif, repeat element or contains contains

administering an agent that can modulate a BNIB gene or protein to a cell or animal. The method is useful inhibiting cell necrosis for treating a neurological disease (e.g. traumatic brain injury, ischaemic and haemorrhagic stroke, Alzheimer's disease, Huntington's disease, amyotropic lateral sclerosis (ALS), multiple sclerosis, AIDS, Parkinson's disease, pick's disease, epilepsy, excitotoxicity, genetic disorders, inborn errors of metabolism, and neurogenesis) or a cardiovascular disease (e.g. cardiac hypoxia, cardiac hypoxia recoxygenation, cardiac schaemic reperfusion injury, ischaemic heart disease, heart failure, heart hypertrophy, by-pass surgery, coronary angioplasty, vascular regeneration and chemotherapeutic induced cardiomyopathy), and for preventing or inhibiting neural cell death, Cardiovascular cell death, or hypoxia-induced cell death. The present sequence represents a BNIP3

                                                                                                                                                                                                                                                                                           homology to other known coding sequences. A pharmaceutical composition comprising the siRNA modulates SOST expression and modulates the ability of sclerostin to decrease osteoblastic activity. It is used for increasing bone density in a mammal and for decreasing apoptosis of bone cells (claimed). It can also be used to modulate bone resorption and augment bone mineralization, to prevent or treat apoptosis of bone-related cells or loss of bone density, and to treat apoptosis, osteomyelitis, hypercalcaemia, osteopenia brought on by surgery or steroid administration, Paget's disease, osteonecrosis, bone loss due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-MAR-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is the antisense strand of a small interfering RNA (sirNA) designed to inhibit expression of the human SOST gene. This gene encodes solerostin, a bone morphogenetic protein antagonist and regulator of bone matrix formation. The SOST target region (see ACF79822) for the SIRNA was selected for its high content of AA dinucleotides and minimal beautions.

Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of CC detecting a single nucleotide polymorphism (SNP) in the optineurin promoter promoter, a host cell comprising the promoter operably linked to a clotheined from a cell or bodily fluid (comprising glaucoma in a sample containing on promoter operably linked to a penotype), detecting a SNP sequence variation in a sample containing DNA, determining the presence of an optineurin promoter sequence variation in a sample containing CC DNA, detecting in loss of visual field in a patient (or the severity or progression of glaucoma or to a progressive ocular hypertensive CC amplification reaction primers that direct amplification of a seected nucleic acid region containing the variation within the optineurin containing the variation within the optineurin containing the variation within the optineurin containing balance and detecting a polymorphism (comprising containing a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and containing the polymorphism (comprising providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and containing the polymorphism. The invention is used to disgnose and containing the containing providing a nucleic acid capable of detecting a solymorphism. The invention is used to disgnose and containing the containing promoter motif, repean to contain a patient or region.

                                                                                                                                                                                                        The invention relates to a novel compound targeted to a nucleic acid molecule encoding a B-cell associated protein (BAP), where the compound specifically hybridises with the nucleic acid and inhibits expression of the protein. The compound of the invention demonstrates cytostatic, antiinflammatory and antimicrobial activities and may be useful for inhibiting the expression of BAP in cells or tissues thus, via antisense

                                                                                                                                                                           CC inhibit expression of the SOST gene. The sequence as selected as a carget from its high content of A dinucleotides and minimal homology to other known coding sequences. The SOST gene encodes sclerostin, a bone cother known coding sequences. The SOST gene encodes sclerostin, a bone composentic protein antagonist and regulator of bone matrix formation. A pharmaceutical composition comprising the siRNA modulates SOST costeoblastic activity. It is used for increasing bone density in a mammal costeoblastic activity. It is used for increasing bone density in a mammal costeoblastic activity of bone cells (claimed). It can also be used to modulate bone resorption and augment bone mineralization, to prevent creat apoptosis of bone-related cells or loss of bone density, and to treat osteoporosis, osteomyelitis, hypercalcaemia, osteopenia brought on by surgery or steroid administration, Paget's disease, osteomecrosis, costeomyelitis, hypercalcaemia, osteopenia brought on by surgery or steroid administration, Paget's disease, osteomecrosis, costeomyelitis, periodontal bone loss, prosthetic costeomyening and osteolytic metastasis

         The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the anti-HCV agent LZ-PAIR DNA-RNA hybri

        The invention relates to an isolated or purified nucleic acid from a virus associated with multiple sclerosis and/or rheumatoid arthritis, multiple sclerosis and/or rheumatoid arthritis, multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise pol, gag or reverse transcriptase genes (or their fragments) encoding the proteins or defined peptides (including immunodominant peptides, antigenic peptides or conserved motifs). Also included are a process for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample, a nucleic acid probe for the detection of a virus associated with multiple sclerosis or rheumatoid arthritis, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and the determination of their relative frequencies constitutes the functional allele profile of the gene of interest in the population. method is useful for determining functional allele profiles which are useful in the treatment and diagnosis of diseases, for genetic and pharmacogenetic applications, and for evaluating the degree to which gene(s) are under selective pressure. The present sequence represents sequencing primer used in the method of the invention.
                                                                                                                                                                              New isolated or purified nucleic acid associated with multiple sclerosis and/or rheumatoid arthritis, useful for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 21

```
viral material associated with multiple sclerosis or rheumatoid carthritis, a polypeptide exhibiting an inhibitory activity on the proteolytic, reverse transcriptase or ribonuclease H activity from MSRV, and an antibody directed against the MSRV-1 virus obtained by immunologically reacting a human or animal body or cells with an immunologically reacting a human or animal body or cells with an immunogenic agent consisting of the antigenic polypeptide defined above. The nucleic acids are useful for detecting a biological sample a virus associated with multiple sclerosis or rheumatoid arthritis, or for detecting in a biological sample, the presence of or exposure to a virus associated with multiple sclerosis or rheumatoid arthritis. The present esquence is a PCR primer used in the isolation of an MSRV sequence. Note: The SEQ ID numbers in the sequence listing.

Consequently those sequences mentioned in the claims may not be the

Example 2; SEQ ID NO 15; 15pp; Japanese

The invention relates to a novel method for detecting differentiation of an osteoclast from the macrophage like cell derived from a monocyte. The method involves making a parameter expression fluctuation of a P2 X4 receptor, a P2 X5 receptor and/or P2 X6 receptor. The method of the invention has osteopathic, antirheumatic, antiarthritic, dermatological, immunosuppressive, antiinflammatory, and cytostatic activity. A preventative agent of the invention which is an inhibitor is useful in the treatment of disease including the abnormality of bone metabolism n of The

Homo sapiens

```
The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABOL288-ABO1414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative cc substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX or NOVX DNA in a CC sample (by introducing the sample to an antibody that binds cc immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, and determining the presence of cc v predisposition to a disease associated with altered levels of CC expression of NOVX or NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent cf or treatment of a pathology related to aberrant expression or aberrant CC physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a crector comprising NOVX DNA, a ccell comprising the vector (used to produce CC NOVX) and an anti-NOVX antibody. The NOVX mucleic acids and polypeptides creating pathologies, diseases, conditions or disorders associated with CC treating pathologies, diseases, conditions or disorders associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          17-SEP-2001

The present invention relates to a method for determining a functional allele profile of a gene in a population. The method comprises identifying the nucleotide sequence of a gene of interest out of genomic DNA from each of a population of individuals identified as having a family history which indicates inheritance of functional alleles of the gene of interest, and rank ordering the frequency of occurrence of each haplotype, where the identity of the alleles containing each haplotype

New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell o tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer. cell or

Example C; Page 563; 849pp; English

commonspecifically to the polypeptide, and determining the presence or camount of antibody bound to the polypeptide), determining the presence of commont of antibody bound to the polypeptide), determining the presence of commont of antibody bound to the polypeptide), determining the presence of commont of notice of commont of pathology related to aberrant expression or aberrant comparising notice of activity of or or flatency or predisposition to a pathology associated with NOVX, a corector comprising NOVX DNA, a cell comprising the vector (used to produce convert) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides care useful as a marker for cell or tissue type, and in diagnosing and congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital pathologies, disease, and succession conditions of disease, multiple sclerosis, infectious diseases, another, cancer cassociated cachexia, neurodegenerative disorders (e.g. Alzheimer's consectated cachexia, neurodegenerative disorders, haematopoietic confects, being the used to screen for molecules which inhibit or consecue of the control of NOVX or an amino acid sequence comprising one or more conservative substitutions in NOVX. Also included are nucleic acids encoding NOV2 proteins, determining the presence or amount of NOVX or NOVX DNA in These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse transcriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein sample (by introducing the sample to an antibody that binds form of NOVX, tion relates to an isolated polypeptide comprising one of 127 (appearing as ABO1288-ABO1414) designated as NOVX, a mature OVX, an amino acid sequence which is at least 95% identical to Q

Sequence 21 BP; 1 A; 8 C; σ G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC NOVX or an amino acid sequence comprising one or more conservative CC substitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX or NOVX DNA in a CC sample (by introducing the sample to an antibody that binds CC immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide), determining the presence or CC amount of NOVX or NOVX DNA in a first mammalian subject, identifying CC expression of NOVX or NOVX DNA in a first mammalian subject, identifying CC an agent that binds to NOVX, identifying a potential therapeutic agent CC reatment of a pathology related to aberrant expression or aberrant CC physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a cell comprising the vector (used to produce CC NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and CC treating pathologies, diseases (or disorders associated with CC congenital heart defects, prostate cancer, diabetes, metabolic disorders, CC disease, multiple sclerosis, infectious diseases, metabolic disorders, CC disease, or Parkinson's disease, immuned disorders (e.g. Alzheimer's CC disease or Parkinson's disease), immuned disorders, haematopoletic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disorders, dyslipidaemias, and wasting disorders associated with chronic diseases. These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse transcriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein
                                                                                                                                                                                     WO2003023008-A2

New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell c tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.

Example 849pp; English.

The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABD1288-ABD1414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative gubstitutions in NOVX. Also included are nucleic acids encoding NOVX CC proteins, determining the presence or amount of NOVX ONA in a CC sample (by introducing the sample to an antibody that binds cC immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, and determining the presence of cc expression of NOVX or NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent cfor treatment of a pathology related to aberrant expression or aberrant cc physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a cc congenital heart defects, prostate cancer, and in diagnosing and creating pathologies, diseases, conditions or disorders associated with NOVX, a congenital heart defects, prostate cancer, diabetes, metabolic disorders, cancer-cc associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease, withindexia, neurodegenerative disorders (e.g. Alzheimer's disease or parkinson's disease), immune disorders associated with chronic cdisorders associated with chronic consociated cachexia, neurodegenerative disorders, haematopoietic disorders, dyslipidaemias, and wasting disorders associated with chronic diseases. These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse transcriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as AB01288-AB01414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative cC proteins, determining the presence or amount of NOVX DNA in a CC sample (by introducing the sample to an antibody that binds CC immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide), determining the presence of CC amount of antibody bound to the polypeptide), determining the presence of CC expression of NOVX or NOVX DNA in a first mammalian subject, identifying CC an agent that binds to NOVX, identifying a potential therapeutic agent CC an agent that binds to NOVX, identifying a potential therapeutic agent CC physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a creening for a modulator of activity of or or flatency or predisposition to a pathology associated with NOVX, a creening pathologies, diseases, conditions or disorders associated with CC NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and CC ROVX segmences, incliding cardismorphy, atherosciences incliding cardismorphy.
                                                                                Query Match

New polypeptides and polynucleotides having stimulation of biochemical or physiological tissue, useful for diagnosing or preventing hypertension, prostate cancer. properties related to responses in a cell or e.g. atherosclerosis,

Ç Page 722; 849pp; English

The invention relates to an isolated polypeptide comprising one sequences (appearing as ABO1288-ABO1414) designated as NOVX, a m form of NOVX, an amino acid sequence which is at least 95% ident identical to

RESULT 1786 ACD06741/c

```
The invention relates to an isolated polypeptide comprising one of 127 csequences (appearing as ABO1288-ABO144) designated as NOVX, a mature form of NOVX, an amino acid sequence which is at least 95% identical to NOVX or an amino acid sequence which is at least 95% identical to NOVX or an amino acid sequence comprising one or more conservative substitutions in NOVX. Also included are nucleic acids encoding NOVX proteins, determining the presence or amount of NOVX DNA in a sample to an antibody that binds immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, and determining the presence of or predisposition to a disease associated with altered levels of expression of NOVX or NOVX DNA in a first mammalian subject, identifying an agent that binds to NOVX, identifying a potential therapeutic agent for treatment of a pathology related to aberrant expression or aberrant physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a vector comprising NOVX DNA, a cell comprising the vector (used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20-SEP-2001;

Grosse WM,
Larochelle 'Boldog FL,
Chapoval A;
          These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse transcriptase (RT)-PCR probe used to assess the tissue specific expression of mRNA encoding a NOVX protein
                                                                                                                                                                                                                                            New polypeptides and polynucleotides having stimulation of biochemical or physiological tissue, useful for diagnosing or preventing
                                                                                                                                                                                                                                      hypertension, prostate cancer.
                                                                                                                                                                                                                                                                                               Æ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated polypeptide comprising one of 127 CC sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence which is at least 95% identical to CC NOVX or NOVX DNA in a first processor or nove conservative and the processor of NOVX DNA in a community of antibody bound to the polypeptide, and determining the presence or CC amount of antibody bound to the polypeptide), determining the presence of CC or predisposition to a disease associated with altered levels of the predisposition of NOVX, identifying a potential therapetic agent for treatment of a pathology related to aberrant expression or aberrant CC physiological interactions of NOVX, identifying a potential therapetic agent CC novx) and an anti-NOVX DNA, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX mucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and CC treating pathologies, diseases, conditions or disorders associated with NOVX. a congenital heart defects, prostate cancer, diabetes, metabolic disorders, associated cachexia, neurodegenerative disorders (e.g. Alzheimer's CC diseases. These may also be used to screen for molecules which inhibit or cenhance NOVX activity or function, and for detecting specific cell types. The present sequence is a reverse cc expression of mRNA encoding a NOVX protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.

Example Ç Page 735; 849pp; English.

The invention relates to an isolated polypeptide comprising one of 127 cc form of NOVX, an amino acid sequence which is at least 95% identical to CC NOVX or an amino acid sequence comprising one or more conservative cc substitutions in NOVX. Also included are nucleic acids encoding NOVX or an amino acid sequence comprising one or more conservative cc substitutions in NOVX. Also included are nucleic acids encoding NOVX cc proteins, determining the presence or amount of NOVX DNA in a cc sample (by introducing the sample to an antibody that binds cor novx DNA in a first mammalian subject, identifying can agent that binds to NOVX DNA in a first mammalian subject, identifying can agent that binds to NOVX, identifying a potential therapeutic agent cf for treatment of a pathology related to aberrant expression or aberrant cypsiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a ccl cror comprising NOVX DNA, a ccll comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as marker for cell or tissue type, and in diagnosing and congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital heart defects, prostate cancer, diabetes, metabolic disorders, congenital excleves, including cardiomyopathy, atherosclerosis, hypertension, cc disease, multiple solerosis, infectious diseases, metabolic disorders, diseases, respective of a cachexia, neurodegenerative disorders, heemstopoietic consenses, dyslipidaemias, and wasting disorders, heemstopoietic consenses, dyslipidaemias, and wasting disorders, heemstopoietic cell types. mapping,

                                                                                                                                                                                                                                 The invention relates to an isolated promoter that is capable of driving transcription in a vascular tissue-preferred manner, and that is native associated with the DNA coding for Prunus servina prunasin hydrolase. The vascular tissue preferred promoters are useful in regulating gene expression in plants to exhibit specific phenotypic traits, such as increased resistance to abiotic stress (e.g. drought, temperature, salinity, ozone, and toxins such as pesticides and herbicides), or to biotic stress such as attacks by pathogens including insects, viruses, bacteria, fungi or nematodes. The present sequence represents a PCR primer specific for the P. serotina prunasin hydrolase variation promoters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecule for regulating gene expression in plexhibit specific phenotypic traits, e.g. increased resistance temperature, toxins or attacks by pathogens including insects,

New polypeptides and polynucleotides having stimulation of biochemical or physiological tissue, useful for diagnosing or preventing hypertension, prostate cancer. properties : ø cell lor

Example C; Page 680; 849pp; English

```
CC variant differ from the mature form, provided that the variant differs in C not more than 15 % of the amino acids from the sequence of the mature CC form. The NOVX polypeptides, nucleic acids encoding the polypeptides, and CC NOVX-associated disorder in humans and for treating a syndrome associated CC with a human disease (NOVX-associated disorder). NOVX polypeptides and CC with a human disease (NOVX-associated disorder). NOVX polypeptides and CC with a human disease (NOVX-associated disorder). NOVX polypeptides and CC predisposition to a disease associated with altered levels of NOVX CC polypeptide is also useful for identifying an agent that the presence of or CC polypeptide is also useful for identifying an agent that CC modulates the expression or activity of NOVX. The antibodies and a cell expression or activity of NOVX. The antibodies and a CC polypeptide having 95 % sequence identify no an agent that CC modulates the expression or activity of NOVX. The antibodies and a CC polypeptide are useful for treating a pathological state in a mammal. The antibodies are also useful for treating a pathological state in a mammal. The antibodies are also constituted to the construction of NOVX polypeptides, polynucleotides and antibodies specific for the polypeptides and a stroke. The NOVX socretains, fungal, protozoal, and parasitic CC infections. They can also treating on preventing disorders or syndromes and protozoal, and parasitic confections. They can also treat disorders such as e.g., Alzhainer's CC disease or a stroke. The NOVX socretains, to detect NOVX mRNA, or a genetic lesion in CC anovx general protosing NOVX activity. Colls complete acids are primers and probes collected the polypeptides and or treating on the presence of the NOVX proteins are useful for col

New chimeric DNA encoding a membrane bound protein, useful for treating conditions associated with cells infected with virus or tumor cells, e.diseases caused by HIV (AIDS), cytomegalovirus, hepatitis C or B, or e.g.

Example 3; Fig 10; 53pp; English

The invention relates to chimaeric DNA encoding a membrane bound protein comprising, in reading frame, DNA encoding: (a) a signal sequence; (b) a CC non-MHC restricted extracellular binding domain of a surface membrane CC protein that binds specifically to at least one ligand, which is a CC protein; (c) a transmembrane domain; and (d) a cytoplasmic signal-CC transducing domain of a protein that activates an intracellular messenger CC system. The extracellular and cytoplasmic domain are not naturally joined to an CC extracellular ligand-binding domain. The chimaeric DNA intitates CC signalling in the host cell when the chimaeric DNA intitates concentrate bound protein in a selected host cell under conditions suitable for expression. Also included are: 1) an expression cassette comprising a transcriptional initiation region, the chimaeric DNA under the CC transcriptional control of the transcriptional initiation region; (2) a retroviral RNA or DNA construct comprising the expression cassette; (3) a cell comprising the C-terminal direction comprising in the N- to C-terminal direction the chimaeric DNA; (4) a chimaeric protein comprising in the N- to C-terminal direction the chimaeric protein as a surface membrane protein; (6) activating cells by means of a secondary messenger pathway; (7) producing a source of cytocoxic effector cells for killing cells infected with virus or cells comprising the sequence and transplanting cells to form modified cell are or tumor cells in a mammal. The DNA, protein cells infected with virus or tumor cells such as diseases associated with cells cinced with cells in a mammal. The DNA, protein cells infected with virus or tumor cells such as diseases caused by HIV (e.g. syndrome), cytomegalovirus, hepatitis C or B, or Mycobacterium avium. The

New polypeptides, designated as NOVX, useful for diagnosing and treating infections, neurological diseases, cancer, allergy, and bone, immunological, skin, renal, brain, muscle and autoimmune disorders.

Example 1; Page 499; 672pp; English.

CC (NOVI - 33), consisting of a mature form of one of 61 sequences, given in CC the specification, or its variant, where amino acid residue(s) in the variant differ from the mature form, provided that the variant differs in CC variant differ from the mature form, provided that the variant differs in CC variant differ from the mature form, provided that the variant differs in CC variant differ from the mature form, provided that the variant differs in CC variant differs in the anino acids from the sequence of the mature of CC variant disease (NOVX-associated disorder). NOVX polypeptides, and CC NOVX-associated disorder). NOVX polypeptides and CC variant disease (NOVX-associated disorder). NOVX polypeptides and CC variant and polymucleoride, by measuring the levels of NOVX propeptide is also useful for determining the presence of or CC polypeptide is also useful for identifying an agent that mother mammal not having or not predisposed to the disease. NOVX CC polypeptide is also useful for identifying an agent that binds to NOVX conditates the expression or activity of NOVX. The antibodies and a cell expression with the expression or activity of NOVX. The antibodies are useful for identifying an agent that binds to NOVX conditates the expression or activity of NOVX. The antibodies are useful for identifying an agent that binds to NOVX propetides, polymucleotides and antibodies specific for the polypeptides, polymucleotides and antibodies specific for the NOVX proteins. The NOVX proteins are useful for detect NOVX RNA, or a genetic lesion in CC and modulating not be not read disorders such as e.g., Alzheimer's disease or a stroke The NOVX activity. NOVX sequences are also useful for broducing non-human transgenic animals which are useful for conditions which are useful for conditions not other cell cueful for producing non-human transgenic animals which are useful for identifying and/or activity of NOVX protein and for identifying calds and useful for exclusions are useful for identifying and/or evaluating. The sur

                                                                                                                                                                                                                                                                    The present invention relates to novel double stranded (ds) DNA sequences which can interact with a third strand to form a stable triple heli. The invention also relates to a method for purifying a ds DNA molecule, comprising contact with a third DNA strand that interacts with a target sequence (TS) in the ds DNA to form a triple helix. To illustrate the invention, an oligonucleotide from human FGF1 gene (ABQ81003) was used as the ds DNA sequence. The present sequence is an oligonucleotide used in affinty chromatography of ABQ81003
                                                                                                                                                                                                                                                                                                                                                                   Purifying double-stranded DNA, useful e.g. for isolating plasmids therapeutic genes, by triple helix formation with oligonucleotide directed to a specific target sequence.

                                                                                                                                  The invention describes an isolated nucleic acid molecule encoding a protein, which regulates fruit size and/or cell division in plants. The nucleic acid is useful in reducing or increasing the size of a fruit and/or cell division in plants. This sequence represents a primer used to analyse the novel Lycopersicon gene ORFX that regulates fruit size and/or

                                                                                                                            The present invention describes an isolated polynucleotide (PN) comprising: (a) a sequence comprising at least 15 contiguous nucleotides of a sequence comprising at least 15 contiguous nucleotides of a sequence comprising variant sequences (A) from Table 4 given in the specification; or (b) a sequence that is complementary to (A). Also described: (1) an array of (PN)s comprising two or more of the isolated (PN)s; (2) detecting a (PN) in an individual; (3) a computer-readable storage medium, where each record has a field identifying a base occupying a (PN) site and a location of the polymorphic site; and (4) a signal carrying data for access by an application program having executed on a data processing system. The (PN) can be used for detecting loci associated with multiple sclerosis. ACF64025 to ACF6424 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ij

                                                                                                                                                           substrate in a different known location. Also described: (1) identifying a gene(s) that is/are up-regulated by an agent; and (2) selecting a candidate compound. The solid substrate comprising the intrinsic reporters of cell signalling are useful for high content drug profiling and toxicity screening. The methods are useful for identifying set of genes that can be used in the initial stages of signal transduction pathways. The intrinsic reporters of cell signalling are also useful for identifying potential drugs that can be used to modulate conditions or diseases that are due to malfunctioning of one or more signal transduction pathways, e.g. diabetes, cancer, neuropsychiatric disorders, chronic and acute pain, or gastrointestinal disorders. ACC42160 to ACC42281 represent oligonucleotide sequences which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ACC42239 standard; DNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC endonuclease (RE). The ON forms, with its complement in (I), an RE CC recognition site that ensures cleavage only at the selected location. CC Contact between (I) and ON, and treatment with RE, are done at a CC temperature at which (i) (I) is maintained in substantially ss form and CC (ii) RE is active. ON is (i) single stranded, and includes a sequence CC that forms, with its complement in (I), the RE site or a type IIS RE CC that cleaves at a remote site formed by complementation of (I) has a double-CC that cleaves at a remote site formed by complementation of (I) and the ss CC region of ON. The method is used to construct libraries of genetic CC packages (phages) that display diverse families of (poly) peptides and CC region of ON. The method is used to rother antibody fragments. The CC libraries are screened to identify (A) for possible therapeutic use. The CC libraries are screened to identify (A) for possible therapeutic use. The CC amplification primers and allows any sequences that may be deleterious to complication to be removed before cloning and display. DNAs are cut only at CC expression to be removed before cloning and display. DNAs are cut only at CC expression to be reverse transcription or amplification, and any natural CC or synthetic site can be used for cleavage. The use of a partially ds ON CC can be created. Both methods allow use of 5 and 3 primers for maximum CC diversity. This sequence represents a sequence used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for determining racing potential of a horse. The method comprises measuring: whether grandpaternal DNA is over-represented in the genome of the horse; or in the case where one of the grandmothers was selected for breeding on the basis of racing performance, whether grandmaternal DNA from the selected grandmother is over-represented in the genome of the horse which indicates that the horse has good racing potential. The method of the invention is useful for determining the racing potential of a horse or for obtaining a progeny horse with good racing potential. This polynucleotide sequence represents a PCR primer used in the detection method of over-representation of DNA from male grandparents of the invention

```

The present invention relates to the isolation of human ATP-binding cassette (ABC) transporter protein A7 (ABCA7) splice variants, and the polynucleotide sequences encoding them. The protein is applicable in the diagnosis and screening of drugs for autoimmune diseases, Sjogren's syndrome, inflammations, abnormal lipid metabolism and arteriosclerosis. It may also be used in a method for screening ABCA-SSN inhibitors. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for determining whether a patient has an increased risk for recurrent prepancy loss, involving determining whether the formin-2 (Fmn-2) gene of the patient has a mutation. The method of the invention is useful for determining whether a patient has a increased risk for recurrent pregnancy loss (RPL/recurrent spontaneous abortion/miscarriage). The sequence represents a PCR primer used in the invention to amplify the Fmn-2 coding sequence
                                                                                                                                                                                                                                                                                                    PCR; primer; ss; retroviral packaging plasmid; retrovirus; gene deliv gene therapy; replication-incompetent; replication-competent; replication-competent; helper virus; LTR; long terminal repeat; virus; psi; xenotropic; amphotropic; ecotropic; polytropic; envelope protein; haematopoietic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Determining whether patient has increased risk for recurrent pregnancy loss by determining whether formin-2 (Fmn-2) gene of patient has mutation, or by measuring Fmn-2 biological activity or Fmn-2 expressio

The invention discloses a retroviral packaging plasmid for producing CC recombinant retrovirus in human cells. Retrovirus vectors have become the CC primary tool for gene delivery in human gene therapy applications. The CC incompetent retroviral helper DNA sequence, derived from a replication-incompetent retroviral penome, encoding, in trans, all virion proteins CC required for packaging a replication-incompetent retroviral vector and CC incompetent retroviral vector at high titer, without production of a creplication-competent helper virus. The retroviral DNA sequence lacks the CC region encoding the native enhancer and/or promoter of the viral 5' LTR (long terminal repeat) of the virus and lacks both the psi function CC sequence responsible for packaging helper genome and the 3' LTR, but encodes a foreign enhancer and/or promoter functional in a selected CC mammalian cell, and a foreign polyadenylation site, from a xenotropic, contropic, ecotropic or polytropic envelope protein. The retroviral packaging plasmid is useful for a high efficiency method to transduce contropic, and producer cells, for the rapid CC packaging himan stable retroviral supernatants and to transduce with high efficiency cells that are refractory to transduce with high cand or packaging that are refractory to transduce with high cand not be controped to the production of high titer viral supernatants and to transduce with high efficiency cells that are refractory to transduction by conventional control and control and service on the packaging plasmids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel retroviral packaging system useful for producing high-titers of recombinant retrovirus in human cells, comprises at least one retroviral helper DNA sequence derived from replication-incompetent retroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 9; 53pp;

                                                                                                                                                          ક
                                                                                                                                                                                                                                                                           CC codon and a targeting nucleotide sequence homologus to a gene of codon and a targeting nucleotide sequence. The fusion protein can which is, in turn, 5' of the targeting sequence. The fusion protein can be a coat protein that is native to the viral genome and is deleted or mutated. Also disclosed are methods of expressing the mutated protein of cinterest at increased or decreased levels by introducing the viral genome into the monocot plant host and for causing a phenotypic or biochemical change in a plant host comprising constructing and introducing into a compositions and methods of the present invention are useful for expressing a fusion protein, a foreign protein or to silence a gene cinterest in a host. They can also be used to screen a cDNA or genomic constructing and order to correlate a nucleotide sequence with a phenotypic or biochemical change. The sequences presented in ABS67534-ABS67616 are the present dischements which were used in the construction of the monocot viral
                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention discloses a method for cytoplasmic inhibition of gene expression in a monocot plant by using a plant viral vector comprising a polynucleotide encoding a promoter operatively linked to a transcriptional unit. The transcriptional unit encodes a fusion protein that comprises a viral protein, a protein of interest and an autoproteolytic peptide fused between them or a viral protein, a stop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR; primer; BSMV; 88; cytoplasmic inhibition; gammab; RNA beta; beta

EC1 is us to prepare adenoviral expression vectors for protein production. EC1 produce expression systems with high expression rates (associated with use of (I)) and allow simple production of genetically modified adenovirus without requiring ligation. The present sequence is that of PCR primer used to generate a rabies surface glycoprotein 1 expression cassette used to exemplify the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Expression cassette containing adenoviral pIX regulatory sequences, useful for preparing new adenoviral vector for large scale protein
                                                                                                            Mouse; formin-2; recurrent pregnancy loss; formin-2; spontaneous abortion; miscarriage; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers ABL59343-44 were used to amplify cDNA encoding an AA233368 protein. This protein is encoded by a benign prostatic hyperplasia (BPH) gene. The BPH gene is differentially expressed in BPH tissue compared to normal prostate tissue. cDNA sequences corresponding to the first and second ORFs were obtained by the oligo-pulling method. BPH nucleic acids and polypeptides may be used as diagnostic agents to detect BPH in a sample or monitor the progression of BPH in a patient. BPH proteins may serve as a target for modulating agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated polypeptide or protein encoded by a benign prostatic hyperplasia gene, useful for diagnosing a disease state such as benign prostatic hyperplasia in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABS97582 standard; DNA; 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            06-DEC-2000; 2000US-0251420P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       06-DEC-2001; 2001WO-US045826
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13-JUN-2002

The method involves determining the length of the contiguous CAG or CAA repeats in both AIBI (Amplified In Breast cancer 1) gene alleles or contiguous CAG, CAA or GGN repeats in the androgen receptor gene of the subject. The method is useful for assessing a subject's risk for acquiring or developing prostate cancer. The present sequence is a PCR primer used to amplify human androgen receptor (AR) gene exon 1 and is used in the molecular analysis and assessment of the
                                                                                                                                                                                                                                                                                                                                                                             Assessing the risk of acquiring or developing prostate cancer in subject, comprises determining the length of the contiguous CAG, and/or GGN repeats in the AIB1 gene and/or androgen receptor gen

cc biological activity of a coagulation pathway factor which involves cadministering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-cc blooded vertebrate is modulated. (I) are also useful for treating cc cardiovascular diseases in the mammal. (II) are useful for modulating E2F cardivity in a warm-blooded vertebrate. (II) are useful for modulating E2F cardivity in a warm-blooded vertebrate. (II) are potent anticoagulants and significantly delay the clotting time of normal human cc plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting cell proliferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for modulating angiogenesis. The RNA aptamers are also useful for diagnostic, cresearch and therapeutic context. The aptamers are useful as diagnostic context they specifically bind, and for identifying substances to which they specifically bind, and for regent for retriaving the targets to which they pass expanding to ABN88713 and ABB81231 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoietin-1 (Ang1) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F famil, member, or Ang1 or Ang2 of about 20 nM or less. (I), (II) and (III) have cardiant and cytostatic activities. (I) are useful for modulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 31; Fig 17; 216pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel RNA aptamers that selectively bind coagulation pathway factors, E family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.

                     The invention relates to a method for preventing diabetes mellitus comprising administering a platelet activating factor acetylhydrolase (PAF-AH) product to a subject at risk of developing diabetes mellitus. The method is also used to slow the progression of diabetes mellitus i patient suffering from the disease. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atheroscles, and arteriosclerosis, and arteriosclerosis, and arteriosclerosis and/or atherosclerosis, and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing a least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, preventing various disorders such as angioedaema and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
                                                                                                                                                                                                                                                             Preventing diabetes mellitus comprises administering a platelet activating factor acetylhydrolase product to a subject at risk developing the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Saccharomyces cerevisiae

                                                                                                                        The invention relates to a novel polynucleotide encoding a human histone acetyltransferase (HA) polypeptide. The protein of the invention has cytostatic activity. The human HA can be used to identify test compounds which may act as activators or inhibitors at the enzyme's active site, in raising specific antibodies which can block the enzyme and effectively reduce its activity, to treat disorders such as cancer, and to screen for human HA activators and inhibitors. HA may also be used in diagnostic assays for detecting diseases and abnormalities or susceptibility to diseases and abnormalities related to the presence of mutations in the nucleic acid sequences which encode the enzyme. The expression vector or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 21 BP; 10
                                                                                   the reagent is useful in the preparation of a medicament for modulating the activity of an HA in a disease, such as cancer. The sequence represents a PCR primer used in the invention to amplify human histone
                                                                                                                                                                                                                                                                                                      New isolated polynucleotide encoding a histone acetyltransferase polypeptide, useful for preventing, ameliorating and/or treating
                                                                                                                                                                                                                                                                                                                                                                                                                    05-FEB-2001; 2001US-0265891P.

CC nucleic acid sequence at one or more polymorphic positions in a gene conding a protein selected from the group above; (3) constructing (M2) C haplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder (C using the polymorphic data; (5) a library of nucleic acids, each of which (C comprises one or more polymorphic positions within a gene encoding a condition with a persent in at least one polymorphic position, and (6) genotyping (M4) an (6) least one position with a known data set. The genes, (M1, M2, M3 and M4) C and compositions are useful for detecting, diagnosing, treating, CC preventing various disorders such as angioedaema and diseases which (6) greventing various disorders such as angioedaema and diseases which (7) c involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's (8) c disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular (8) concer, wounds, viral, bacterial or fungal infection, Chronic Obstructive pulmonary diseases (COPD) and enteriocolitis (many other (7) c polynucleotides are also useful for chromosome identification and the find of the specification). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 (KLKI), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5 and 3 flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising obtaining the sample from one or more individuals and determining the
   Sequence
                                                                                                polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid from a human encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDF tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid with at least one polymorphic position, use for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 804; 977pp; English.

CC encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein CC (1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme CC (2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising CC obtaining the sample from one or more individuals and determining the CC encoding a protein selected from the group above; (3) constructing (M2) caplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder CC using the polymorphic data; (5) a library of nucleic acids, each of which CC comprises one or more polymorphic positions within a gene encoding a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2365 AGCTGCTCACAGAGAGGAGGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification
                                                                                                                                                                           Tsuchihashi Z, Hui

```
CC 1 (KLH1), bradykinin receptor B2 (BDKBB2), angiotensin converting enzyme CC (ACE2) or protease inhibitor 4 (P14), comprising at least one CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising additional 5 and determining the sample from one or more polymorphic positions in a gene CC nucleic acid sequence at one or more polymorphic positions in a gene CC nucleic acid sequence at one or more polymorphic positions in a gene CC nucleic acid sequence at one or more polymorphic positions in a gene CC upon administration of an ACE inhibitor and/or vasopeptidase inhibitor CC using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a comprising obtaining a nucleic acid sample, determining the nucleid present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M3, M3 and M4) and CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's cdisease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular contents of sarbery diseases, arteryiosclerosis and/or atherosclerosis, and
                                                                                                                                                                                                                                                         artery disease, arteriosclerosis and/or atherosclerosis, and hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronobstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antiboo polynucleotides are also useful for chromosome identification.

                                                                                                                                                                                                                                                                                                                                                                                                                                              Chronic
```

```
CC nucleic acid sequence at one or more polymorphic positions in a gene ce encoding a protein selected from the group above; (3) constructing (M2) CC haplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder (CC using the polymorphic data; (5) a library of nucleic acids, each of which (CC comprises one or more polymorphic positions within a gene encoding a CC human protein selected from the group above; and (6) genotyping (M4) an (6) individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, correventing various disorders such as angioedaema and diseases which (CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's (CC hypertrophy, vascular diseases, aneuryem, embolism, thrombosis, coronary (CC hypertrophy, vascular diseases, aneuryem, embolism, thrombosis, coronary (CC hypertrophy, vascular diseases, aneuryem, embolism, thrombosis, coronary (CC arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic Obstructive pulmonary disease (COPD) and entercolitis (many other coliseases and disorders are listed in the specification). The

CC encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (EDKRB1), C1 esterase inhibitor (CLNH), kallikrein C1 (KLK1), bradykinin receptor B2 (EDKRB2), angiotensin converting enzyme C2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one C2 polymorphic position. Also included are (1) a probe that hybridises to a C3 (CD polymorphic position as provided in the detailed summary of single C4 (CD polymorphisms comprising additional 5 and 3 flanking genomic C5 sequence; (2) analysing (M1) at least one nucleic acid sample comprising C6 obtaining the sample from one or more polymorphic positions in a gene C7 encoding a protein selected from the group above; (3) constructing (M2) the plotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder C6 upon administration of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a protein selected from the group above; (3) constructing (M2) constructing (M3) an individual at risk of developing a disorder C7 upon administration of an ACE inhibitor and/or vasopeptidase inhibitor comprises one or more polymorphic positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) cand compositions are useful for detecting, diagnosing, treating,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 1756

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mimics), in absence and presence of test compounds. The compounds modulate the activity (especially cytokine release) and migration of T cells. The migration of T cells into lesions is a good marker for infiltration of other immune system cells. The compounds are used for treatment and/or prevention of arteriosclerosis, particularly in combination with hypocholesterolemic agents. The present sequence represents a primer which is specific for Valpha14
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Primer used to amplify cDNA encoding VL region of mAB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes a method of screening for compounds, which useful for prevention and/or treatment of atherosclerosis in humans. The method comprises the comparative detection of T cells carrying the invariant chain Valpha14-Jalpha281 in atherosclerotic lesions (or their

```
The specification describes a chimeric protein which has, in N- to CC terminal direction, a non-major histocompatability complex (MHC) CC restricted extracellular binding domain, transmembrane domain, and CC cytoplasmic signal-transducing domain of protein that activates intracellular messenger system. The chimeric protein is expressed as CC membrane bound protein in the host cell which initiates signalling, when CC the extracellular domain binds a ligand. The transmembrane domain is CC chain, CD3 gamma chain, CD3 delta chain, and the CD3 epsilon chain. The CC chain, CD3 gamma chain, CD3 delta chain, and the CD3 epsilon chain. The CC extracellular domain and the cytoplasmic domain binds the CC extracellular domain and the cytoplasmic domain are not naturally joined CC together (or vice versa), and when the extracellular domain binds the CD3 independent of the chimeric DNA is expressed as a membrane bound protein in a compatible cell under conditions suitable for expression, which initiates the chimeric particular pathways controlled by signal transduction. The chimeric CC protein is also useful for gene therapy. The present sequence represents a PCR primer, used to produce vectors which are used in the production of single chain antibody. The present sequence represents
